Running the Competition

The CD drives one screen. The base station owns the clock, speaks the call-up and the cues, drives every timer watch in step, and writes down each flight as it is flown.

THE SCREENS, AND WHO LOOKS AT THEM

PAGE	WHAT IT IS FOR
Run CD	Heat queue, live clock, START / ABORT, timer status, flight log. The one that matters.
Results scorer	Every recorded flight; add or delete one by hand to fix something.
Leaderboard anyone	Live standings. Marked **unofficial** for an imported comp.
`/display` · `/pilot`	Read-only live views: full-screen for a field display (F11), phone-sized for pilots.

ONCE, BEFORE THE FIRST HEAT

- ☐ **Settings → Audio** — output chosen, volume set, **Test** audible *from where the pilots stand*
- ☐ **Settings → Audio → Call-up** — default on or off for the day
- ☐ **Settings → Connected Timers** — all present, all on the **same firmware**
- ☐ Watches numbered (**Renumber**), charged, handed to the right callers
- ☐ **Rounds** — the round 1 draw reads correctly

The protocol is versioned, so a mixed fleet is a mixed protocol. The base updates stale watches by itself — but only while no heat is loaded.

THE HEAT CYCLE

repeat per heat — the clock runs itself from START

IDLE	CALL-UP	PREP	WORKING	LANDING	IDLE
load a heat	names read out	countdown + beeps	the round itself	landing window	times are in

1. **Click the next heat in the queue.**
   It goes LOADED and the pilot list reaches the watches at once — before prep, so there is time to choose.
2. **Each caller picks their pilot on the watch.**
   L / R to scroll, **hold** R to confirm — the name then replaces `BASE OK`.
3. **Press START.**
   The base now runs everything — call-up, prep countdown and beeps, the long tone at window open, the time calls, the landing window. A watch with no pilot picked raises a yellow panel, but nothing stops you starting.
4. **Flight times arrive by themselves**
   as each flight is stopped, into the log on the right. Back at IDLE, mark the heat ✓ DONE and load the next; completed heats sink to the bottom of the queue.

The buttons on the Run screen

START	Begins the sequence. Needs a loaded heat.
ABORT	Stops the round dead, **heat stays loaded** — so you can re-run it.
✕ CLEAR	Puts the heat down *without* running it.
🔊 CALL-UP	On or off **for this heat only**; an amber dot means it is overriding the Settings default.
SKIP TO 1:00	During prep, when everyone is already on the line.
✓ DONE	Marks the heat complete. ↩ **Undo** reverses it.

THE WATCH, DURING A ROUND

R click	**Start / stop the flight** — the one button that matters. The screen reads `FLYING (3)`: the launch number, which is what a launch-limited task needs.
L click	**Scratch** the flight just recorded (confirm with R). On a Poker round it **declares the next call** instead.
At time up	The results screen ranks the best times by colour. L pages a long log, and opens **Round Recall** — the watch's own record of the last three rounds.

Start buttons are locked while the watch is connected — the base owns round starts — and unlock in the last two seconds of prep. A launch before the window opens is flagged red, scores zero, and **still consumes a launch**.

F5K — altitude entry

After time up the watch asks for each flight's motor-cut altitude in turn:

R click	+1 m — ones digit, rolls 9 → 0
L click	+10 m — tens digit, rolls 100 → 0
hold R	Confirm, move to the next flight

Target tasks — Poker and Ladder

The base tells the watch which task and how to fly it. The flight clock counts **down to the target** — that is what the timekeeper calls to the pilot — and landing flashes `ACHIEVED` or `MISSED`. Only an achieved call scores, so the time-up list shows the call beside the flown time.

WHEN SOMETHING NEEDS FIXING, AND HOW THE DAY ENDS

Fixing things

Wrong time recorded	*Results* → delete it, add it back correctly
Heat must be re-flown	ABORT, delete that heat's flights on *Results*, START again
Watch drops out	It times on alone and re-sends on reconnect; nothing is lost
Wrong heat loaded	✕ CLEAR, load the right one; swapping mid-round is refused

CSV fallback: GliderScore → Export also offers a CSV. After importing it, check the pilots matched — it carries the base station's own pilot IDs, not GliderScore's numbers.

Results back to GliderScore

1. On **GliderScore → Export**, download **F3KSync.exe** onto the CD's PC.
2. Run it, point it at the GliderScore folder, enter the base station's URL, press **Connect**.
3. Choose the competition and press **Sync Scores**.

> **ALWAYS FINISH IN GLIDERSCORE**
> The base records flight times; drops, normalisation and penalties belong to GliderScore, so the day's last action is **Recalculate** there. Copy the results from **Settings → Data Backup** first.
